ChattyOh — user flows

DESIGN ARTIFACT · PROPOSED FLOWS

Early process maps derived from the draft product requirements. These flows are not evidence that the underlying features are implemented.

1. First project and planning

Sign in
Authenticate through the chosen identity provider.

→

Create workspace
Select personal or team workspace.

→

Create project
Name the project; start with a blank project or template.

→

Plan in chat
Keep messages attached to the project context.

→

Create tasks
Use domain actions so permissions and gates apply.

2. Document review

Generate draft
Use the LLM gateway; label content as a draft.

→

Edit and version
Save an immutable revision with author and timestamp.

→

Submit for review
Move through the server-side review action.

→

Review
Authorized reviewer inspects the version and changes.

→

Approve or return
Record decision and audit event.

3. Agent test and controlled execution

Configure
Select model, instructions, tools, and run limits.

→

Test
Run cases and inspect outputs and traces.

→

Approve
Reviewer checks policy and sensitive actions.

→

Execute
Run within step, time, and cost limits.

→

Inspect history
Review outcomes, approvals, and audit records.

4. Lifecycle gate and recovery

Request transition
Client requests a project-stage action.

→

Check gate
Server reads current tests and open critical findings.

→

Blocked?
Return a reason and keep state unchanged, or continue.

→

Fix and retry
Resolve the condition and request the action again.

> **Implementation note:** Current prototype capabilities are incomplete and mostly local. Authentication, server-side gates, real agent execution, integrations, and approvals are part of the backend plan, not implemented services.
